

**Original Research Article****Determine Demographic Characteristics of Women Involvement on the Improved Methods of Groundnut Processing in Three (3) Local Government Areas of Niger State, Nigeria.****ABSTRACT**

There is gender division of women in farm labour in Niger State (Abba et al. 2011). The gender division of women in farm labour assigns women more works in the processing of groundnut as Agricultural food products and yet, women have no access to improved methods of groundnut processing and depend mainly on the traditional methods the purpose of this study therefore were to determine the demographic characteristics of women involvement on the improved methods of groundnut processing in there (3) Local Government Areas of Niger State. Two specific objectives guided the study. A multi-stage sampling procedure were employed in the selection of the respondents. The first state were purposive selection of Agricultural zone one of the state AMDA because of the high concentration of the respondents in the zone (NAMDA, 2012). This were followed by random selection of there (3) Local Government Areas (LGAs) from the zone which is equivalent to three AMDA Extension blocks. The third stage were random selection of four (4) extension cells from each of the Extension blocks, from an existing list of registered women groundnut processors Association (314) with sate AMDA, a total population samples size of 180 respondents were randomly selected. A structured questionnaire were used to collect data pertinent to the study with the help of Enumerators. Data were descriptively analyzed. Demographically, majority of the respondents were between the age distribution of 21-50 years and married, majority of the respondents in the study area had their household size of between 6-10 people. About 50% of the respondents had no access to formal education and 57% had 1-6 years in schooling. The result also revealed that about 32% of the respondents had 15-20 years of groundnut processing experience and about 55% of the respondents had their major occupation has full time processor. The recommendation made include need for the government and interested non government organization (NGOs) to provide credit facilities for respondents to enable them involved into improved methods of groundnut processing technologies.

**INTRODUCTION**

In today's digital age, the latest technologies always reach the rural poor last in spite of recent advances in communication and information technologies (CTA, 2003). Rural women are much less likely to have access to new agricultural technologies because they are generally less educated and possess less economic and political power relative to their men folk. In Nigeria, reports indicated that women play more important roles in agricultural processing compared to men (Umar *et al.* 2003). While records further show that the agricultural labour force is made up of about 60-80 percent women depending on the region, and two thirds of the foods crops is processed by the women, (World Bank, 2003). Despite these facts there still exists wide spread assumption that men and not women make the key management decisions (Christiana *et al.* 2007). As a result of this, most extension activities targeted at women emphasize their domestic

43 roles with topics such as child care and family nutrition while excluding activities involving  
44 agricultural processing.

45 Basically, women are involved in the supply of labour, processing of food crops and livestock  
46 processing and transportation farm produce for effective storage and marketing Shannon, (2005).  
47 Ugwu and Agbo, (2009). Despite the high level of their involvement in agricultural processing  
48 activities such as groundnut processing, they are inadequately recognized and undervalued Ajayi,  
49 (2005); Henn, (2005); Nwachuku and Jibowo, (2007).

50 Women's role in groundnut processing is not a new phenomena. Their role is fundamental to  
51 agricultural growth/ development especially via Agricultural food processing. They account for  
52 100 percent for those who process agricultural food stuff (UN, 2004). In Nigeria, women take  
53 part actively in the groundnut processing activities in addition to their domestic household  
54 responsibilities. According to Abba, *et al.* (2011). Women are said to be involved in over 95  
55 percent of groundnut milling activists in "Zone A" agro ecological area (Bida of Niger State).

56

## 57 **Problem Statement**

58 The declaration of 1975-1985 as decades for women by member countries of the United Nations  
59 (UN) marked the beginning of recognition of gender issues in development circle worldwide.  
60 This resulted in active discussion among researchers policy makers, educationists and  
61 developmental partners on roles of women vis- a vis those of men (Yahaya, 2002). This led to  
62 the creation of Women In Agriculture (WIA) programme within the existing state Agricultural  
63 Development Projects (ADPs) and the conversion of women home economists to female  
64 Agricultural processors, all in an attempt to correct the gender related deficiencies and  
65 recognition of the role play in extension and processing of agricultural commodities. There is  
66 gender division of women in farm labour in Nigeria, Nkoh, and Domenico, (2005). The gender  
67 division of women in farm labour assigns women more works in the processing of groundnut as  
68 agricultural food products and yet, women have no access to improved methods of groundnut  
69 processing and depend mainly on the traditional methods, due to the constraints that are  
70 responsible for it, such as poor electricity supply, lack of credit facilities, high purchasing price  
71 of technologies increase in price of petrol, poor processing equipments poor quality of groundnut  
72 and absence of sustainable policy for groundnut processing activities. All this constraints affect  
73 women processors involvement of improved groundnut processing technologies.

74

## 75 **PURPOSE AND OBJECTIVES**

76 The purpose of the study was to determine the demographic characteristics of women  
77 involvement on the improved methods of groundnut processing in three (3) Local Government  
78 Areas of Niger State.

79 Specific objectives were to:

- 80 1. Examine the demographic characteristics of women involvement on the improved  
81 methods of groundnut processing in the study areas.
- 82 2. Identify the constraints faced by women processors in the study area.

83

84

85

86

## 87 **METHODOLOGY**

### 88 Study area

89 The study was conducted in three Local Government Areas of Niger State. This Local  
90 Government Areas is located in Agricultural zone one of the state. The climate and ecological  
91 condition of is favourable with mean annual rainfall of 782-1250mm and temperature is about  
92 27.70° (Tswanye, 2007). The Agricultural zone has abundant wild vegetation of shea trees and  
93 dominated by small scale famers the major crops grown are mullet, rice, maize, guinea corn,  
94 beans, cassava and groundnuts.

95

### 96 **Method of Data collection and sampling procedure.**

97 The data used were obtained mainly from primary sources, through the use of structure  
98 questionnaires. With the help of enumerators. The sampling method adopted for the study were  
99 multi-stage sampling procedure techniques. The first stage was purposive selections of  
100 Agricultural zone one of the state AMDA. This was followed by random selection of three (3)  
101 Local Government Areas (LGAs) from the zone which is equivalent to three AMDA extension  
102 blocks.

103 The third stage was random selection of four (4) extension cells from each of the extension  
104 blocks, giving a total sampling size of 180 women processors used in the study area.

105

## 106 **ANALYTICAL TECHNIQUE**

107 Analysis of the data was done using descriptive statistics which include measure of central  
108 tendency such as means, percentage, table and frequency distribution.

109

## 110 **RESULTS AND DISCUSSION**

### 111 Demographic characteristics

112 Demographic characteristics of the respondents in the study area were examined and described  
113 with respect to their Age, marital status, Household size, educational level, year of schooling,  
114 year of processing experiences and major occupation.

115

### 116 **Age**

117 The age distribution of the respondents in the study area were between 21-50 years (81.1%). This  
118 implies that they were young and energetic within the productive age which could increase their  
119 groundnut processing activities. This was in agreement with finding of Musa (2006) in  
120 indigenous resources managements among communities in North West Zone of Nigeria which  
121 revealed that the women processors are of the middle age category of 40-50 years of age. This  
122 implies that, the productive age groups of women processor in the study area were actively  
123 involved in groundnut processing activities and still have energy to cope with rigors of  
124 groundnut processing.

125

### 126 **Marital Status**

127 About 67% of the respondents in the study area were married. The implication is that  
128 respondents that were married are more involved in the improved groundnut processing  
129 technologies in the study area.

130 This was in line with study by Maigida (2008). Which revealed that marital status of women  
131 processors play a significant role, in groundnut processing activities where improved

132 technologies are involved for instance married women processors with large family size may  
133 have large involvement and readily supply of labour, which reduces the cost of hired.

134

## 135 **Household Sizes**

136 About 48% of the respondents has household size of between 6 and 10 people. The implication is  
137 that the higher the number of household size the lower the cost of labour this was in agreement  
138 with Adepoju and Umar (2007) which revealed that In agricultural food processing, household  
139 size determines the availability of labour. The additional labour to be hired depends on the  
140 amount of family labour available and reduce the cost of hiring more hand for such activities.

~~141~~

## 143 **Educational Level**

144 About 50% of respondents in the study area have no access to formal education. The implication  
145 of this result implies that the low level of formal education is obviously a disadvantage to the  
146 respondents, due to the fact that improved technologies would have to be communicated to these  
147 respondents in native dialects. This view was in line with findings of Adepoju and Umar (2007).  
148 which revealed that education enables every individual to gain knowledge and skills and this  
149 increase their power of understanding.

150

## 151 **Years of Schooling**

152 About 57% of the respondents had 1-6 years in school which implies that majority of the  
153 respondents had primary school qualification. The implication of this result is that 1-6 years may  
154 not be enough for the respondent to have more knowledge about improved technologies.

155

## 156 **Years of Processing Experience**

157 About 32% of the respondents had 15-20 years of processing experience. This result was in line  
158 with finding of (Johnson, 2009). The study revealed that high experience in agricultural  
159 processing can raise productivity

160 The mean years of experience of the respondents were 15.57 years. The high mean years of  
161 processing experience suggests that the respondents would not have many problems in involving  
162 and effective use of improved technologies.

163

## 164 **Major Occupation**

165 About 55% of the respondents in the study area are full time processors as their major  
166 occupation. The implication of this result is that respondents will involved and adopt improved  
167 technologies. This view was in line with the study by (Yahaya, 2002), which revealed that major  
168 occupation determine the level of involvement and adoption of improved technologies.

## 232 Respondents Constraints

233 About 92% of the respondents in the study area reported that poor electricity constraints were  
 234 among of their problems faced. about 80% of the respondents also indicated that lack of credit  
 235 facilities were also their problems such as loan, condition attached to loan disbursement, interest  
 236 rate, collateral and several trips to the bank before loan is granted. This finding was in agreement  
 237 with (Saito, 2009) which revealed that women face a number of barriers to obtained credit from  
 238 lending institutions because most of them have no collateral. The implication of this is that,  
 239 without loan to facilitate the involvement and adoption of improved groundnut technologies, the  
 240 respondents will not expand the scope of processing women processor will continue to queue for  
 241 long at the extraction point. Another problem experienced by the respondents were increase in  
 242 price of Petrol.

243 About 95% the respondents reported that petrol engine is used for processing when there is no  
 244 electricity supply, and the women tend to spend more as the cost of kneading is high which is not  
 245 economical for the respondents. The constraints increase in price of petrol has negative influence  
 246 on involvement and adoption. It can be concluded here that, if prices of petroleum products are  
 247 not reduced some of the women processors might revert to the use of the traditional methods of  
 248 groundnut processing.

249 About 94% of the respondents reported that they still faced with constraints of poor processing  
 250 equipment because these technologies are expensive to acquired and then emphasized in  
 251 traditional methods of groundnut processing.

252

253 **Table 2: Distribution of respondents based on Constraints (n=180)**

254 Constraints	254 Frequency	254 Percentage %
255 Poor Electricity	165	91.7
256 Lack of Credit Facility	144	80.0
257 High purchasing Price of Technologies	170	94.4
258 Increase in price of petrol	171	95.0
259 Risk Associated with Technologies	165	90.0
260 Price floutation	164	91.1
261 Poor Processing Equipment	170	94.4
262 Poor Quantity of G/Nut	167	92.8
263 Poor Capacity Building	162	90.0
264 Lack of viable commercial practice	163	90.6
265 Need for organization producer	164	91.1
266 Absence of Sustainable policy	144	80.0

269 \* Multiple Responses

270

## 271 CONCLUSION AND RECOMMENDATION

272 The study has provided information on demographic characteristics of women involvement on  
 273 the improved methods of groundnut processing in three Local Government Areas of Niger State,  
 274 Nigeria. Majority of the respondents do not have access to formal education and this can affect  
 275 disseminations of information (printed maternals) on any new technologies to the respondents.  
 276 The constraints such as poor electricity high cost of petrol supply, lack of credit facilities, high

277 purchasing price of technologies poor and lack of operational facilities for processing groundnuts  
 278 affect the level of women involvement on the improved of groundnut processing technologies in  
 279 the study area. Base on the findings in the study the following recommendations are made

- 280 1. In view of the high cost of petroleum products and irregular electricity supply, which are  
 281 required for groundnut processing activities. It was recommended that provision of solar  
 282 powered electricity by interested NGOs to address the irregular power supply should be  
 283 made a priority intervention in the study area.
- 284 2. It was found that majority of the respondents in the study area lack access to credit  
 285 facilities. It is recommended that credit facilities should be provided by the government  
 286 and interested non Government organization to increase the scope of groundnut  
 287 processing business and improved their level of living.
- 288 3. The study revealed that respondents faced with high purchasing price of technologies.  
 289 Constraints it is recommended that improved groundnut technologies should be made  
 290 available for the respondents at the subsidies rate. This can be done though appeal to  
 291 interested Non Governmental Organizations (NGOs) private volunteers and other  
 292 organized bodies to assist government in complementing the present high purchasing  
 293 price of technologies to the respondents.
