

1 **Economic Analysis of White-Leg Shrimp (*Penaeus vannamei*) Production.**

2 **Case Study: Rudong County of Nantong city, Jiangsu Province, China**

3  
4  
5 **Abstract**

6 This paper examines the economic performance of White-leg shrimp (*Penaeus vannamei*)  
7 production in Rudong county of Nantong city, Jiangsu province, China. White-leg shrimp  
8 (*Penaeus vannamei*) production is an important economic activity in the overall farming  
9 system in China. Despite the current achievements witnessed by white-leg shrimp production,  
10 there are many challenges (high cost of production, disease, over feeding, effluent discharge,  
11 lack of technical knowledge, low educational level, inexperienced managers, among others)  
12 continuing to set back the growth of this sector in China. Three seasonal crops data in 2016  
13 were collected from 52 white leg shrimp farmers. Descriptive statistics, profitability and  
14 regression analysis were employed in the data analysis. The study revealed that all white-leg  
15 shrimp farmers sampled were males. Most farmers (78.9%) belonged to an age group of 41-  
16 60 years with 6-10 years farming experience. Operational costs of White-leg shrimp farming  
17 accounted for 89.2% out of the total cost with feed, fingerlings and fuel representing 34.3%,  
18 13.1% and 12.7% respectively. Farmers obtained an average revenue of CNY 924,359.74  
19 (US\$140,516.51)/ha from shrimp sold at an average price of CNY 43 (US\$6.60)/kg and  
20 secured a net profit of CNY 378,144.55 (\$57,483.63)/ha. The gross margin ratio (0.47),  
21 benefit cost ratio (0.69) and return on investment (0.69) revealed that white-leg shrimp is  
22 economically viable. Feed cost, cost of fingerling and experience showed negative significant  
23 effect on revenue at 5%, 10% and 1% respectively while farm size and average price showed  
24 positive effect on revenue at 1% level of significance.

25  
26 **Key Words:** Economic Analysis, White-Leg Shrimp (*Penaeus vannamei*), Jiangsu, China

## 27 **Introduction**

28 Chinese shrimp farms are located along the coastline nearly 18,000km from Hainan province  
29 (South) in the tropics to Liaoning province (North) in the temperate region. The main shrimp  
30 producing provinces in China are Guangdong, Guangxi, Zhejiang, Jiangsu, Shandong, Fujian,  
31 and Hainan [26]. There are about 14,000 shrimp farms in China, [2]. According to [Cao and](#)  
32 [Ling](#) [3], in northern province of China, extensive system of shrimp farming is usually  
33 practice by farmers, especially for those who have to farm shrimp with seawater. While in the  
34 southern province, intensive farming system is common especially for white-leg shrimp (*P.*  
35 *vannamei*) species, which is featured by pond built in supralittoral zone with a central drain  
36 and aerating equipment. Presently, green-house pond is used in the south for over-wintering  
37 and harvest is done during the early spring. It has been reported that in the southern province,  
38 farms generally have 2-3 production cycles per year, while in the northern province, farms  
39 normally have one cycles per year due to the winter season [3]. China is the world largest  
40 producer of shrimp, follow by Thailand, Vietnam and Indonesia [7].

41

42 Shrimp is the most valuable fisheries commodity in the world representing 15% of the total  
43 value of international traded fisheries products [7]. China is the second largest exporter in  
44 volume of farmed shrimp after Thailand [13] and third largest exporter by value globally.  
45 Shrimp stands out as the highest economic value seafood products export from China. As one  
46 of the major producers, China is determined to meet the needs of both international and  
47 domestic demand for shrimp especially its delicious taste with high protein. It contributes to  
48 animal protein intake, employment generation, household incomes, foreign exchange  
49 earnings and livelihood of farmers. Many investors and aquaculturists are hopeful about the  
50 potential of shrimp farming industry in China because of the vast domestic shrimp markets  
51 indicating the confidence and enthusiasm to the future of the industry. The study attempted to  
52 investigate the economic analysis of white-leg shrimp production using enterprise budget  
53 approach including, revenue, net income, gross margin, gross margin ratio, benefit cost ratio  
54 and return on investment among others.

55

56

57

## 58 **Overview of White-leg Shrimp Production in China**

59 Shrimp production in China has been increasing over the past years especially the white-leg

60 shrimp (*Penaeus vannamei*) which has followed a general trend of increasing output [8].  
 61 Total white-leg shrimp production increased from 60,5259mt (2002) to 1,672246mt (2016  
 62 with a growth rate of 0.053% (Fig. 1). The year 2014 saw a sharp decline of freshwater  
 63 white-leg shrimp production of 140,606mt (2014) 81,2545mt (2013) [4]. [Prein \[19\]](#) and [Cao  
 64 and Ling \[3\]](#) have also reported that this increase in white-leg shrimp production has been  
 65 achieved with intensification of farming systems by large commercial companies. White-leg  
 66 shrimp (*P vannamei*) output surpassed 1.37mt and accounted for 40% of farmed shellfish  
 67 production nationwide [12]. In spite of the growing trend in white-leg shrimp (*P. vannamei*)  
 68 output, increase in the number of farm sites have occurred only in more recent years from  
 69 provinces such as; Guangdong, Jiangsu, Zhejiang, Hainan, Guanxi and also to lesser extend  
 70 in Shandong, Fujian and other provinces [11]. In 2016, annual production of white-leg shrimp  
 71 in China has recorded of about 1.67 million mt (Fig. 1) [4].

72 **Fig.1:** Production of white leg shrimp (*P. vannamei*) in China, 2002-2016.

73 [Data source: 5].

74  
 75  
 76 **White-Leg Shrimp Production in Jiangsu Province, China**

77 The production of shrimp has been increasing primarily in Guangdong, Jiangsu, Hubei,  
 78 Zhejiang and Guangxi provinces. Jiangsu province has been regarded as one of the leading  
 79 producers of aquatic products. In 2012, total aquatic production in Jiangsu province for  
 80 seawater and freshwater were estimated at, 1,421 tons and 3,339 tons respectively totaling to  
 81 4,760 tons. Hubei, Guangdong, and Jiangsu provinces are the largest producers of freshwater  
 82 cultured shrimp [12]. Annual white-leg shrimp (*P. vannamei*) production in Jiangsu province  
 83 reached a record of 179,750mt in 2015 of which freshwater and seawater accounted for  
 84 152,111 tons (84.62%) and 27,639mt (15.38%) respectively and a total decline in 2016

85 (179,587mt) as a result of a decline in seawater white-leg shrimp production (20,904mt) (Fig.  
86 2).

87

89

[Data source: 4].

90

## 91 **Problem Statements**

92 Production of white-leg shrimp (*Penaeus vannamei*) is a very important economic activity in  
93 the farming system in China. The practice of white-leg shrimp farming is gaining popularity  
94 in most areas in China. In spite of the present successes witnessed by white-leg shrimp  
95 farming, there are many challenges continuing to set back the growth of this sector in Jiangsu  
96 province, China. The risk of disease outbreak has a significant negative effect on farm  
97 economy and this is a major concern in the shrimp industry. The outbreak of disease can  
98 cause massive crop failure, which can largely challenge sustaining production and affect  
99 profitability of the sector [3]. Moreover, over feeding and effluent discharges have created  
100 challenges for policy makers and threaten the sustainable development of shrimp aquaculture.  
101 In addition, lack of technical knowledge, low educational level, inexperienced managers,  
102 high cost of production, inefficiencies, differences in socio-economic characteristic and  
103 management practice are some of the problems that are hampering the success of shrimp  
104 farming in the study areas.

## 105 **Objectives of the study**

106 The aim of this study is to assess the economic performance of White-Leg Shrimp (*P.*  
107 *vannamei*) production in Jiangsu Province and examine the factors affecting revenue  
108 generation.

109

## 110 Hypotheses

- 111 1.  $H_0$ : High costs of feed and fingerling does not lead to less revenue;
- 112 2.  $H_0$ : There is no significant relationship between the farm size, average price of the white-
- 113 leg shrimp products and the revenue.

114

## 115 Materials and Methods

### 116 Study Location

117 The study was conducted in Rudong county in the Nantong city of Jiangsu province, **East**  
118 **Coast** of China. Rudong is a municipal government area with 14 towns and 5 districts with an  
119 area of 1,872 Km<sup>2</sup> and a total population of 1.08 million people.

120

121

122 **Map.1: Study Area**

122

123 (Source: **24**)

123

124

125

126 It is located on the bank of the Yellow Sea **25**. Nantong city is located in Jiangsu province  
127 on the northern bank of the Yangtze River, near the river mouth. It has an area of 8,544 Km<sup>2</sup>  
128 with a population of about 7.3million people of 2010 census. Nantong is a vital river port  
129 bordering Yancheng to the north, Taizhou to the west, Suzhou and Shanghai to the south  
130 across the river and the East China Sea to the east **24**. The author chose Jiangsu for the  
131 study because is among the three largest producers of White-leg shrimp (*Penaeus vannamei*)

132 in China. Nantong city is the largest shrimp producer in Jiangsu province of which Rudong  
133 county stands out as the largest contributor [25].

134

### 135 **Data collection and sampling method**

136 The primary data used for carrying out this study was a cross-sectional data for three crop  
137 seasons in 2016. Each of the crop seasons is made up of three months hence the three cop  
138 seasons total 9 months. Data collection commenced in October 2017, and with the final field  
139 work completed in November 2017. Information and data were collected from 52 white-leg  
140 shrimp farmers in the study areas using structured questionnaires. The questionnaires were  
141 first tested among 10 white-leg shrimp farmers in Rudong County, before it was finally  
142 administered.

143

### 144 **Data analysis**

145 All the data collected were coded and entered into a statistical package for social sciences  
146 (SPSS). SPSS version 20 and Microsoft Excel 2007 spreadsheets were used in the analysis.  
147 Descriptive statistics, enterprise budget and regression (ordinary least square) analysis were  
148 used in analysis. All the calculations in this study were based on ( $1 \mu=667 \text{ m}^2$ ) for average  
149 shrimp production area.

150

### 151 **Analysis of profitability**

152 | [Salim](#) [22] described profitability analysis model as deterministic assumption, where random  
153 variables reflected by uncertain factors of production can be easily added. The budgetary  
154 analysis of profitability was obtained using Equation 1 to Equation 6:

155 Net Farm Income (NFI) = TR – TC Eqn.1

156 Benefit Cost Ratio (BCR) =TR/TC Eqn.2

157 Gross Margins Ratios (GMR) = (TR – TVC)/TR Eqn.3

158 Return on Investment (ROI) = NFI/TC Eqn.4

159 Percentage Profitability (PP) = NFI/TCx100 Eqn.5

160 Where:

161 TR = Total revenues, TC = Total cos, TVC = Total Variable cost, NFI = Net farm income,

162 TC = Total cost.

163

164

165 **The break-even point rules**

166 To conduct breakeven analysis, the fixed costs was divided by the price minus the variable  
167 costs as shown in Equation 6:

168 **Breakeven Point = Fixed Costs/ (Unit Selling Price - Variable Costs)** Eqn.6

169

170 **Regression Analysis**

171 This was used in this research to examine the factors that affect shrimp production. All the  
172 functional forms were tested before selecting the double log which was best fit for Cobb-  
173 Douglas production function model [21]. To estimate the factors affecting revenue (output),  
174 ten inputs variables were included in the analysis. The output is the revenue of the white-leg  
175 shrimp production while the inputs used were cost of feed [9], cost of fingerlings, fuel cost,  
176 labor cost, cost of chemicals, and fixed cost [18]. In addition, household size, experience,  
177 average price [23] and farm size [1] were included in the model. This model shows the  
178 relationship between dependent variable (Y) and independent variables. ( $X_1, X_2, X_3, X_4, X_5,$   
179  $X_6, \dots, X_{10}$ ). The production function used is specified as follows (Equation 7).

180  $\ln Y = b_0 + b_1 \ln X_1 + b_2 \ln X_2 + b_3 \ln X_3 + b_4 \ln X_4 + b_5 \ln X_5 + b_6 \ln X_6 + b_7 \ln X_7 + b_8 \ln X_8 + b_9 \ln X_9$   
181  $+ b_{10} \ln X_{10} + E$

182 Eqn.7

183 Where:

- 184 **Y** = Dependent variable (Revenue)      **X<sub>1</sub>**, = Cost of feed      **X<sub>2</sub>** = Cost of fingerling  
185 **X<sub>3</sub>** = Cost of fuel/electricity      **X<sub>4</sub>** = Cost of labor      **X<sub>5</sub>** = Cost of chemical  
186 **X<sub>6</sub>** = Household size      **X<sub>7</sub>**= Farm Size      **X<sub>8</sub>**= Average price  
187 **X<sub>9</sub>** = Fixed cost      **X<sub>10</sub>** = Experience  
188 **b<sub>0</sub>** = Constant term      **b<sub>1</sub> – b<sub>2</sub>** = Parameters that were estimated      **E** = Error term

189

190

191 **Results**

192 **Socio-economic features of the white-leg shrimp farmers**

193 The result of the socio-economic features of the respondents are summarized in Table 1.

194 **Table 1:** Socio-economic characteristics of the white-leg shrimp farm owners

Variables	Classification/Range	Frequency	Percentage
<b>Gender</b>	Female	5	9.6
	Male (farm owners)	47	90.4
	<b>Total</b>	52	100.0
<b>Age of farmers/ respondents</b>	21-30	1	1.9
	31-40	7	13.5
	41-50	24	46.2
	51-60	17	32.7
	>60	3	5.8

	<b>Total</b>	52	100.0

195 **Source:** Field survey

196 Majority (90.4%) of the white-leg shrimp farm owners sampled were male while female  
 197 (mostly family members) represent 9.6%. Most (46.2%) of the respondents fall within the age  
 198 group of 41-50 years, 32.7% fall within the age bracket of 51-60. The minimum and  
 199 maximum age of farmers ranges from 22 to 75 years (48.9±8.25). Regarding the educational

level, the result showed that 32.7% of the respondents had one form of educational (Primary and junior high school) exposure while 51.9% and 15.4% had senior high school and college education respectively. The Table 1 also shows that 59.6% of the farmers have 6-10 years of experience in white-leg shrimp farming. Experience ranges from 2 to 24 years with average experience of 8.2 years and standard deviation of 4.2 years. Based on household size, the result indicated that most of respondents have 3-5 persons per family, representing 78.8%. Household size is between 2 to 8 people (4.6±1.3). Finally, 94.2% of the respondents had secured technical training.

208

### 209 Sources of Input Employed

210 Table 2 shows different types of sources of inputs employed by the white-leg shrimp farmers  
211 in the study area.

212 **Table 2:** Percentage distribution of Inputs employed in white-leg shrimp production

Variables	Classification/Range	Frequency	Percentage (%)
<b>Sources of seed/feed</b>	Self-breeding/self-made feed	8	15.4
	Buy from local enterprise	40	76.9
	Buy from non-local enterprise	4	7.7
	<b>Total</b>	<b>52</b>	<b>100.0</b>
<b>Weight of seed</b>	(5-8g)	6	11.5
	(10-12g)	46	88.5
	<b>Total</b>	<b>52</b>	<b>100.0</b>
<b>Type of feed used</b>	Sinking pellet	49	94.2
	Floating pellet	3	5.8
	<b>Total</b>	<b>52</b>	<b>100.0</b>
<b>Financial sources</b>	Individual savings	47	90.38
	Loan from relative	21	40.38
	Loan from bank	17	32.69
	Loan from relatives	3	5.77
	<b>Total</b>		<b>171.15*</b>

213 \*Total percentage greater than 100 as a result of multiple responses

214 **Source:** Field survey, 2017

215 Most (76.9%) of the respondents sourced shrimp seed, feed and medicine from local  
216 enterprise, 15.4% of the farmers make their own feed and breed their own fingerlings while  
217 7.7% sourced feed and seed from non-local enterprise. Majority (94.2%) of the farmers used  
218 sinking pellet while 5.8% used floating pellet. The results further showed that most (90.38%  
219 showing multiple responses) of the respondents sourced their working capital from personal  
220 savings. 40.38% of the farmers used loan from relative, 32.69% accessed loans from the bank

221 while 5.77% sourced funding from cooperatives.

222

### 223 **White leg shrimp farm size (ha) and stocking density**

224 The areas of shrimp farm (ha) owned by the farmers is shown below. Most (57.7%) of the  
225 farm size operated by the farmers is less than 7ha. Majority (69.2%) of the farmers stocked  
226 between 1,000,000-40,000,000ha fingerlings while 30.8% of the respondents stocked  
227 between 41,000,000-200,000,000ha fingerlings. The mean stocking density of fingerlings  
228 was 31,618,245.5.

229 **Table 3:** Area of Shrimp farming (size/ha) and stocking density (ha)

Variables	Range	Frequenc y	Percent age	Min	Max	Mean	Std.
<b>Area-2016</b>	<b>&lt; 7.0</b>	30	57.7				
	7-27ha	22	42.3	26.7	2000.4	240.75	311.08
	<b>Total</b>	52	100.0				
<b>Stocking density</b>	1,000,000-40,000,000	36	69.2	1,017,2	150,030	31,618	29,837,4
	41,000,000-200,000,000	16	30.8	97.4	,000.0	,245.5	94.9
	<b>Total</b>	52	100.0				

230 **Source:** Field survey.

231

### 232 **Profitability and Breakeven Analysis of white-leg shrimp production**

233 Table 4a and b show the costs as well as returns and profitability ratios of White-Leg shrimp  
234 farming with variable costs (89.2%) representing the largest cost out of total cost of white-leg  
235 shrimp production. Feeds alone accounted for the largest proportion (34.3%) of the total cost.  
236 This is followed by fingerlings, fuels and labors costs, accounting for 13.1%, 12.7% and 10.4%  
237 respectively, of the total costs.

238

**Table 4a:** Costs analysis of White-Leg Shrimp Farms.

Cost Items	Amounts CNY (US\$)/ha	Percentage (%) Total Cost
<b>Variable Costs</b>		
Fingerlings	71,407.61 (\$10,855.03)	13.1
Shrimp feed	187,173.58 (\$28,453.18)	34.3
Chemical	24,798.18 (\$3,769.69)	4.5
Labor wage	57,038.40 (\$8,670.69)	10.4
Electricity/fuel	69,098.43 (\$10,504.00)	12.7
Manger salary	45,673.08 (\$6,942.99)	8.4
Others	32,147.39 (\$4,886.88)	5.9
<b>Total Variable Cost (TVC)</b>	<b>487,336.67 (\$74,082.46)</b>	<b>89.2</b>
<b>Fixed Costs</b>		
House construction	10,150.64 (\$1,53.05)	1.9
Pond construction	24,988.46 (\$3,798.62)	4.6
Hatchery construction	3,130.77 (\$475.92)	0.6
Aerators	4,254.81 (\$646.79)	0.8
Feeders	2,458.33 (\$373.70)	0.5
Pump	4,047.12 (\$615.22)	0.7
Vehicle/Tricycle	7,685.90 (\$1,168.37)	1.4
Boats	200.00 (\$30.40)	0.0
Nets	481.73 (\$73.23)	0.1
Others	1,480.77 (\$225.10)	0.3
<b>Total Fixed Cost (TFC)</b>	<b>58,878.53 (\$8,950.42)</b>	<b>10.8</b>
<b>Total Cost</b>	<b>546,215.20 (\$83,032.88)</b>	<b>100.0</b>

240

**Source:** Field survey

241

Exchange rate: USD1=CNY6.5783 (12/24/2017)

242

243 The fixed cost accounted for 10.8% of the total production cost. Also, the result revealed that  
 244 the farmers spent a total cost of CNY546,215.20 (US\$83,032.88)/ha (Table 4a) and secured a  
 245 total revenue of CNY924,359.74 (US\$140,516.51)/ha with a net farm profit of  
 246 CNY378,144.55 (\$57,483.63)/ha from shrimp sold at an average price of CNY43/kg (\$6.60)  
 247 (Table 4b).

248

**Table 4b:** Returns and profitability ratios of White-Leg Shrimp Farms

Yield (kg)	21,283
Price of shrimp (kg)	43 (\$6.60)
Revenue	924,359.74 (\$140,516.51)
Net Farm Income (NFI)/Profit	378,144.55 (\$57,483.63)
Gross margin	437,023.07 (\$66,434.04)
Benefit Cost Ratio (BCR)	1.69
Gross Margin Ratio (GMR)	0.47
Return on Investment (ROI)	0.69
Percentage Profitability (PP)	69.23
Breakeven Price	25.6
Breakeven Yield	2,867

249

250 The results of the profitability ratio analysis showed that the white-leg shrimp farmers in the  
 251 study area had a positive Gross Margin Ratio (GMR) of 0.47, a Benefit Cost Ratio (BCR) of  
 252 1.69, Return on Investment (ROI) of 0.69 and Percentage Profitability (PP) of 69.23. From  
 253 Table 4b, it can be seen that the breakeven yield and the breakeven price were recorded as  
 254 2,867 Kg and CNY25.7 (\$3.90)/kg, respectively.

255

256 **Regression Results; Factors influencing white-leg shrimp production**

257 Table 5 shows the results of the regression analysis of factors affecting revenue. The  
 258 independent variables such as input variable (feed, fingerling, labor), socio-economic  
 259 variables like, farming experience, household size showed negative relationship with  
 260 revenue. Other independent variables included were farm size and average price both  
 261 exhibiting positive relationship with revenue.

262 **Table 5:** Multiple regression analysis result of the determinant of shrimp revenue.

Variables	Unstandardized Coefficients		Standardized Coefficients Beta	t	Sig.
	B	Std. Error			
(Constant)	-1.924	4.703		-2.842	.007***
Feed	-1.468	5.235	-.083	-2.191	.034**

263 Dependent Variable: Revenue, \*\*\*Variables significant @1%, \*Variables significant @10%

264

**Data source:** Field survey.

265

266 **Test for Hypothesis 1: H<sub>0</sub>: High cost of feed and fingerling does not lead to less revenue**

267 Based on the result in Table 5, it was revealed that the costs of feed and fingerlings showed  
 268 negative relationship with revenue. This negative sign indicated that feed and fingerlings  
 269 moved in opposite direction to revenue. In addition, feed and fingerlings were statistically  
 270 significant at 5% and 10% respectively. Which means, high cost of these input variables  
 271 affect revenue negatively. This explanation does not agree with the null hypothesis that states

272 that high cost of feed and fingerlings does not lead less revenue but rather in favour with the  
 273 alternative.

274

275 **Test for Hypothesis 2: H<sub>0</sub>: There is no significant relationship between the farm size,**  
 276 **average price of the white-leg shrimp products and the revenue**

277 With regards to the results, farm size and average price of white-leg shrimp product exhibited  
 278 positive relationship at 1% level of significant to revenue. It means that 1% increase in the  
 279 average price of shrimp products would result to 23.5% increase in revenue. The larger the  
 280 farm size the more revenue generation ceteris paribus. Based on this strong statistically  
 281 significant level of 1% for farm size and average price with revenue, the null hypothesis  
 282 which states that there is no significant relationship between farm size, average price and  
 283 revenue is rejected and the alternative is accepted. That is, there is significant relationship  
 284 between farm size, average price and revenue.

285

286 **Constraints encountered by shrimp farmers**

287 Table 6 summarized the constraints encountered by farmers in White-leg shrimp production.  
 288 Total percentage is greater than 100% indicating multiple responses. The major constraints  
 289 highlighted by the farmers are; Quality of shrimp seed (80.8%), Water quality (63.5%) and  
 290 shrimp disease (32.7%) while minor constraints were low shrimp price (13.5%). frequent  
 291 natural disaster (5.8%) and technology request (3.8%).

292 **Table 6:** Percentage distribution of constraints encountered by shrimp farmers

Variables	Frequency	%*
Quality of shrimp seed	42	80.8
Shrimp disease	17	32.7
Water quality	33	63.5
Low shrimp price	7	13.5
Frequent natural disaster	3	5.8
Technology request is high	2	3.8
<b>Total</b>		200.0*

293 (\*) Total percentage greater than 100% due to multiple responses

294 **Data Source:** Field survey.

## 295 Discussion

### 296 Farmer's socio-economic characteristics

297 Gender is an important socio-economic factor that plays significant role in aquaculture, in  
298 terms of assets acquisition, for example, land and machines. Majority (90.4%) of the White-  
299 leg shrimp farmer sampled for this study were males. With regards to age, it has been  
300 revealed that most White-leg shrimp farmers' fall within the ages of 41 to 60 years  
301 representing 78.9%. These are within the productive and economically active ages which  
302 indicate better future for shrimp production. This assertion is in agreement with [Tammaroopa](#)  
303 [et al.](#) [23] ~~who~~ investigated socioeconomic factors affecting white shrimp production in  
304 Thailand. His results revealed that almost half of the farmers had an age group between 41-55  
305 years. In term of the household size, it was discovered that 78% of the respondents have  
306 family size ranging from 3-5 persons per household. It means that increase in household size  
307 can lead to an increase in white-leg shrimp production. This result is in line with [Kumolu-](#)  
308 [Johson and Ndimele](#) [10] that large family size supports productivity in fish farming. The  
309 research further discovered that the respondents usually get technical training from fellow  
310 farmers and organizations. Majority (90.38%) of the respondents depended on their own  
311 personal savings source of funding. This result is in agreement with the findings of [Ekanem](#)  
312 [et al.](#) [5] ~~which-who~~ stated that most fish farmers in Cross River and Ogun States, Nigeria  
313 sourced working capital from personal savings. The study also revealed that very few shrimp  
314 farmers access loans from bank (32.69%). This could be as a result of high interest rate. This  
315 assertion is in line with the suggestion given by [Omobepade et al.](#) [18] who said that the  
316 inability of fish farmers to assess bank might be connected to its high rate of interest.

317

### 318 White-Leg Shrimp production costs and profitability

319 Based on the cost and return analysis, it was revealed that the four most important cost items  
320 among the production cost are shrimp feed (34.3%), fingerlings (13.1%), fuel/electricity cost  
321 (12.7%) and labour (10.4%). [Hoai](#) [9] conducted a study on White-leg shrimp farming in  
322 Song Cau District, Phu Yen Province Vietnam and concluded that the highest variable cost  
323 item is feed which accounted for 45.19% of the total cost of production. [Olaoye](#) [15] had also  
324 reported that farmers had to spend large sum of money on feeds during production process.  
325 The high cost of electricity shows that significant amount of money was spent by white-leg  
326 shrimp farmers on electricity to run aerators, pumps and feeders for efficient shrimp  
327 production. This may be as a result of the fact that China has expanded electricity even to the

328 most remote rural areas hence contributing to an increase productivity and profitability from  
329 aquaculture production.

330 Revealed from the profitability analysis showed that white-leg shrimp farmers obtained a  
331 profit of CNY378,144.55 (\$57,483.63) per hectare. [Hoai \[9\]](#) examined the profitability of  
332 White-leg shrimp farms and revealed an average profit of 78,883,209 VND (\$3,944.16), per  
333 hectare for the shrimp farmers. Benefit Cost Ratio (BCR) was found to be 1.69. It means that  
334 the white-leg shrimp farming is profitable because the BCR is greater than 1 and farmers can  
335 pay for both fixed and operational costs. [Olagunju et al.\[14\]](#) indicated that as a rule of thumb,  
336 project with cost ratio greater than one, equal to one or less than one, shows profit, break-  
337 even or less profit, respectively. White-leg shrimp farming is profitable with positive Gross  
338 Margin of CNY437,023.07 (\$66,434.04). This is in agreement with the finding of [Emokaro et](#)  
339 [al. \[6\]](#) that fish farming enterprise were profitable in the short run with gross margin greater  
340 than total variable cost. [Olasunkanmi \[16\]](#) also reported that positive gross margin shows that  
341 a fish farming enterprise would make reasonable profit as long as these farms kept overhead  
342 costs in control. The research discovered that the Percentage Profitability (PP), Return on  
343 Investment (ROI) and Gross profit margin ratio were found to be 69.23%, 0.69 and 0.47  
344 respectively. For every 1.00CYN (\$1.00) invested, the farmers were able to gain CYN0.69  
345 (\$0.69) at a percentage rate of 69.23%. [Okpeke et al. \[17\]](#) in their study on fish farming,  
346 showed that the return on investment was 0.92 which implies that for every one naira  
347 invested, 92 kobo was gained. The higher gross profit margin shows the farms are profitable.  
348 According to [Olasunkanmi \[16\]](#), a ratio of 0.35 or higher is more desirable.

349

### 350 **Regression analysis of explanatory variables**

351 Multiple regression results revealed that white-leg shrimp revenue is significantly influenced  
352 by the cost of inputs. Out of the 10 independent variables, 5 significantly influence revenue at  
353 various level of significance. Cost of feed, seed, experience, farm size and average price  
354 significantly influence revenue at 5%, 10%, 1%, 1% and 1% level of significance respectively.  
355 Farm size and average price met their expected signs of positive while the other three were  
356 negative. It shows that an increase in farm size and average price would increase the overall  
357 revenue of the farmers and vice versa for the others. According to [Omobepade et al. \[18\]](#),  
358 input costs affect revenue. For the farm size, the study agreed with the finding that large farm  
359 sized produced the highest yield [1]. The result further revealed that one unit increase in the  
360 average price of white-leg shrimp products resulted to 23.5% increase in revenue. This

361 finding is in agreement with the ideas of [Tammaroopa et al. \[23\]](#) which states that an increase  
362 in average price of shrimp will lead to an increase in white-leg shrimp production. [Quagraine](#)  
363 [\[20\]](#) also stated that selling price was the most significant variable for white-leg shrimp  
364 production.

365

## 366 **Conclusions**

367 Based on the analysis and the results obtained, it can be concluded that most White-leg  
368 shrimp farmers in the study area depend on their own source of savings for farming. A high  
369 percentage of farmers bought seeds and feed from local enterprise and operate less than 7ha  
370 of pond size. The three major highest production costs are: feed, fingerlings and  
371 electricity/fuel cost. The results further showed that White-leg shrimp farms are profitable  
372 based on the percentage profitability, return on investment and gross margin ration obtained.  
373 The factors affecting revenue are: cost of feed, cost of seed, experience. Farm size and  
374 average price of White-leg shrimp production. The three important challenges faced by the  
375 farmers are low quality of seed, water quality and disease.
