

Editor's Comment:

I believe that this study should be published modifying the suggestions I describe so that the article can have the format that is used in most journals that have an impact factor and are included in databases such as PubMed.

Suggestions:

Remove the calculation of the sample from the summary.

I suggest that the objectives be eliminated, it is enough with the description of the aim of the study.

Effectively, the methodology to calculate the sample size should be referred (in which article or methodology were they based to decide that the sample should have 100 subjects?).

The authors must title the tables, for example: Table 1. myths about oral hygiene practices.

It would be convenient at the end of the discussion to declare the conclusions of the study.
