

**Editor's Comment:**

I have made numerous corrections and changes to the manuscript as required for the authors; See attached manuscript correction and the **clean copy (correction 2)**. However, the authors still need to address the comments I made in the clean copy before the manuscript is accepted for publication. They can use the clean copy to make the corrections.

**Author's Feedback:**

**Thank you for your patience. I have revised the manuscript again. According to your comments I made corrections. If some not suitable, please point at it.**

**Editor's Comment:**

Only a few corrections were made to the manuscript. The followings were left undone:

1. Catalogue number was omitted
2. Quantity of Niacin was not mentioned.
3. Kit and catalog number was omitted
4. Move the sequence to supplementary file was omitted

There is still a lot of grammatical error in the manuscript that makes it difficult to understand. I will suggest that the authors seek the help of a Molecular Biologist and language editor who will help them put the manuscript in a better shape suitable for publication. These way readers will understand their research clearly.

**Author's Feedback:**

**I have revised the manuscript again according to your suggesting, however, some problems still exist. If not suitable for publication, I am willing to pay for being revised by other person pointed by the editor.**
