

1 **Anti-Inflammatory activity and *Insilco* Approaches on root extract of *Decalepis hamiltonii***  
2 **Wight & Arn**

3 **ABSTRACT**

4 **Aims:** The present study was aimed to evaluate anti-inflammatory and antioxidant  
5 potential of methanol root extract of *Decalepis hamiltonii*. **Results** The methanolic extract  
6 showed *invitro* anti-inflammatory activity inhibition cells 96.1%µg/ml respectively. **MTT** assay  
7 was significant inhibited by the methanol (96.2) and inhibition addition the **NO** production  
8 25µg/ml 95% inhibition. The methanol extract of *Decalepis hamiltonii* shows a Thus, a very  
9 strong approach to In-silico docking and in vitro anti-inflammatory study for whole with these  
10 compounds/extracts. **Conclusion.** From the study it is concluded that the root extract of  
11 *Decalepis hamiltonii* showing a strong approach to InSilico docking and anti inflammatory  
12 activity.

13  
14 **Keywords:** *Decalepis hamiltonii*; MTT assay; NO; FRAP

15 **1. Introduction**

16 Medicinal plants have been used as age long remedies for human diseases because they  
17 contain components of therapeutic value. The plants are naturally large source of antioxidants,  
18 anticancer, antidiabetic agents they might be serve as leads for the development of novel drugs.  
19 The research and analysis on plants employed as pain-relievers and anti-inflammatory agents in  
20 traditional ethno medicine is one of the productive and logical strategies in the search for new  
21 drugs [1-2]. Free radicals, which have one or more un-paired electrons (superoxide, hydroxyl,  
22 peroxy) are produced in normal or pathological cell metabolism and the compounds that can  
23 scavenge free radicals have great potential in ameliorating the diseases and pathological cells [3-

24 6]. The increase in the prevalence of multiple drug resistance has shown down the development  
25 of new synthetic anti-inflammatory drugs and the new drug is necessary to search for new anti-  
26 inflammatory from alterative sources. Phytochemicals from medicinal plants showing anti-  
27 inflammatory activities have the potential of filling this need because of the structures of  
28 phytochemical different from those of the more studied and they're those of the more action may  
29 too very likely differ [7]. In this growing interest, many of the Phytochemical bioactive  
30 compounds from a medicinal plants have shown many pharmacological activities [8-11]  
31 Inflammation are a pathological condition in which highly reactive species are produced. Nitric  
32 oxide (NO) is a small diffusible molecule responsible for vasodilatation, neurotransmission and  
33 inflammation. This molecule is produced by the organism at a basal concentration. Nevertheless,  
34 under stimulation by pathogens, NO is generated in higher amounts by the inducible nitric oxide  
35 synthase (iNOS) in activated macrophages(). The over production of NO is involved in the  
36 pathogenesis of septic shock, tissue damage, multiple organ dysfunctions and carcinogenesis  
37 processes [12]. Natural products have contributed significantly towards the development of  
38 modern medicine. Recently, traditional medicine worldwide has been re-evaluated by extensive  
39 research on different plant species and their active therapeutic principles. The rich wealth of  
40 plant kingdom can represent a novel source of newer compounds with significant anti-  
41 inflammatory activities. The major merits of herbal medicine seem to be their perceived efficacy,  
42 low incidence of serious adverse effects, and low cost. This *Decalepis hamiltonii* (Wight & Arn),  
43 popularly known as swallow root in English, belongs to the family *Asclepiadaceae*. It is a  
44 climber with stout, smooth branches shrub and a native of the forests of Deccan peninsula and  
45 Western Ghats of India. The leaves are curvaceous, orbicular or elliptical, with rounded tip. Its  
46 tubers are consumed as the pickles and the juice for its alleged health promoting properties The

## 50 2. Material and Methods

### 51 2.1 Collection of material

52 The Root of *Decalepis hamiltonii* has been collected from kolli hills, Namakkal district of  
53 Tamilnadu, India. The taxonomic identification of plant was done with comparing the Flora of  
54 Presidency of Madras, by Gamble J.S., 1921.

### 55 2.2 Preparation of solvent extraction

56 50gm of *Decalepis hamiltonii* root was packed in Soxhlet apparatus for extraction and  
57 500 ml of methanol was used as solvent. Soxhlet was kept running for 72 hours, until the solvent  
58 colour appears in the collection tube. Methanol was removed by evaporation using rotavapour at  
59 not more than 40°C. The residue was then placed in an oven at 40°C for about 48hours to  
60 remove the moisture. The resulting dried mass was then powdered and used for further studies.

Comment [A20]: Why was rotary evaporator not used for this purpose rather than oven. The active ingredients could have been denatured by the oven. Which methodology is this?

### 61 2.3 Ferric Reducing antioxidant Power

62 The Ferric reducing antioxidant power of different parts of the various crude extracts of  
63 *Decalepis hamiltonii* was evaluated by [14]. The samples were mixed with 2.5 ml of 0.2 M Phosphate  
64 buffer (pH 6.6) and 2.5 ml of 1 per cent potassium ferric cyanide. After the mixture was incubated at 50  
65 °C for 20 min, 2.5 ml of 10 per cent TCA, 2.5 ml distilled water and 0.5 ml of 0.1 per cent ferric  
66 chloride was added and then the absorbance was measured at 700 nm against a blank. The blank  
67 consist of all the reagents without the test sample. The reducing power of gallic acid was also

Comment [A21]: Punctuation

Comment [A22]: Small letter

Comment [A23]: were

Comment [A24]: read at

68 determined for a comparison. High absorbance of the reaction mixture indicates strong ferric reducing  
69 antioxidant power.

#### 70 **2.4 MTT assay**

71 The monolayer cell culture was trypsinized and the cell count was adjusted to  $1.0 \times 10^5$   
72 cells/mL using medium containing 10% new born calf serum. To each well of the 96 well micro  
73 titre plate, 0.1 mL of the diluted cell suspension (approximately 10,000 cells) was added. After  
74 24 hours, when a partial monolayer was formed, the supernatant was flicked off, washed the  
75 monolayer once and 100  $\mu$ L of different drug concentrations was added to the cells in microtitre  
76 plates. The plates were then incubated at 37°C for 3 days in 5% CO<sub>2</sub> atmosphere and  
77 microscopic examination was carried out and observations recorded every 24 hours. After 72  
78 hours, the drug solutions in the wells were discarded and 50  $\mu$ L of MTT (2mg/mL) prepared in  
79 Hank's balanced salt solution (HBSS) without phenol red was added to each well. The plates  
80 were gently shaken and incubated for 3 hours at 37°C in 5% CO<sub>2</sub> atmosphere. The supernatant  
81 was removed and 50  $\mu$ L of propanol was added and the plates were gently shaken to solubilize  
82 the formed formazan[15]. The absorbance was measured using a microplate reader at a  
83 wavelength of 540 nm.

#### 84 **2.5 Nitric Oxide Production**

85 The Nitric oxide (NO) production in cell culture were determined by measuring the  
86 nitrite (NO<sub>2</sub>) formation by using Griess assay as described by [16]. Briefly, 100 $\mu$ L of griess  
87 reagent (Sigma-Aldrich, USA) containing 1% sulfanilamide and 0.1% naphthyl ethylenediamine  
88 dihydrochloride in 2.5% H<sub>3</sub>PO<sub>4</sub> was added to 100  $\mu$ L of cell culture supernatant and incubate for  
89 15 minutes at room temperature in the dark. The color density was measured at 540 nm using a

92 The compounds namely 2-Hydroxy-4-methoxybenzaldehyde ~~hwere~~ identified by GC-MS  
93 analysis were screened against the anti diabetic, anti inflamaentroy and cancer protein. The  
94 compound details were retrieved from the Pubchem database and the chemical structures were  
95 generated from SMILES notation (Simplified Molecular Input Line Entry Specification) by  
96 using the Chemskech Software (www.acdlabs.com).

Comment [A34]: what is this???

## 97 2.7 Protein Data Bank

98 The Protein Data Bank (PDB) archive is the single worldwide repository of information  
99 about the 3D structures of large biological molecules, including proteins and nucleic acids. The  
100 Protein Data Bank (PDB) is a repository for the three-dimensional structural data of large  
101 biological molecules, such as proteins and nucleic acids. The data, typically obtained by X-ray  
102 crystallography or NMR spectroscopy and submitted by biologists and biochemists from around  
103 the world, are freely accessible on the Internet via the websites of its member organizations  
104 (PDBe, PDBj, and RCSB). The PDB is overseen by an organization called the Worldwide  
105 Protein Data Bank, WWPDB.

Comment [A35]: What is the relevance of this history

## 106 2.8 Preparation of protein structure

107 The structural information of the macromolecules determined by x-ray crystallographic  
108 and NMR methods are available in the PDB. The 3D structure protein Receptor (PDB I.D: 4IFI)  
109 was downloaded from the Protein Data Bank (PDB) (<http://www.rcsb.org/pdb/>) the water  
110 molecules were removed from protein file 4IFI before docking. Energy minimization by  
111 applying for CHARMM (Chemistry at Harvard Macromolecular Mechanics) force fields, It's a

112 program for macromolecular dynamics; it can be used for energy minimization, normal modes  
113 and crystal optimizations and also incorporates free energy methods for chemical and  
114 conformational free energy calculations.

## 115 2.9 PUBCHEM

116 The Pubchem bioassay data (<http://pubchem.ncbi.nlm.nih.gov>) is a public repository for  
117 biological Activities of small molecules and small interfering RNAs (siRNAs) hosted by the US  
118 National Institutes of Health (NIH). It archives experimental descriptions of assays and  
119 biological test results and makes the information freely accessible to the public. A Pubchem  
120 Bioassay data entry includes an assay description, a summary and detailed test results. Each  
121 assay record is linked to the molecular target, whenever possible, and is cross-referenced to other  
122 National Center for Biotechnology Information (NCBI) database records. 'Related Bioassays'  
123 are identified by examining the assay target relationship and activity profile of commonly tested  
124 compounds. A key goal of PubChem Bioassay is to make the biological activity information  
125 easily accessible through the NCBI information retrieval system- Entrez, and various web-based  
126 PubChem services. An integrated suite of data analysis tools is available to optimize the utility of  
127 the chemical structure and biological activity information within PubChem, enabling researchers  
128 to aggregate, compare and analyze biological test results contributed by multiple organizations.  
129 Describe the PubChem Bioassay database, including data model, bioassay deposition and  
130 utilities that PubChem provides for searching, downloading and analyzing the biological activity  
131 information.

Comment [A37]: Why tis history? I thought we were in methodology

## 132 2.10 Preparation of Ligand structures

133 The identified Chemical compound namely 2-Hydroxy-4-methoxybenzaldehyde was  
134 derived from *Decalepis hamiltonii* Wight & Arn and this compound structure were retrieved  
135 from Pubchem online server both of these compounds were under investigation of ChemsSketch  
136 (Chemically intelligent drawing interface free ware developed by Advance Chemistry  
137 Development, Inc., (<http://www.acdlabs.com>) was used to construct the structure of the ligands.  
138 The ligand molecules were generated and the three dimensional optimizations were done and  
139 then saved MOL file (a file format for holding information about the atoms, bonds, connectivity  
140 and coordinates of a molecule).

Comment [A38]: Check it up

#### 141 2.11 Drug likeliness prediction

142 Ligand property was predicted by using “Lipinski drug Filters” ([http://www.scfbio-  
144 iitd.res.in/utility/LipinskiFilters.jsp](http://www.scfbio-<br/>143 iitd.res.in/utility/LipinskiFilters.jsp)). Lipinski rule of five helps in distinguishing drug-like and non-  
145 drug-like properties and predicts high probability of success or failure due to drug likeliness for  
146 molecules. The Lipinski filter helps in early preclinical assessment and thereby avoiding costly  
late stage preclinical and clinical failures.

#### 147 2.12 Docking analysis:

148 The docking analysis is performed by Argus lab 4.0.1 for the antidiabetic and cancer  
149 protein interacts with GC-MS of *Decalepis hamiltonii* 2-Hydroxy-4-methoxybenzaldehyde  
150 compound. The compound or ligand selected for based on Lipinski's rule of five. Fitting points are  
151 added to hydrogen bonding groups on the protein. The interaction between the binding pockets of  
152 target protein, antidiabetic protein and 3v6r inflammation protein and investigation compound to  
153 find out the accurate binding model for the active site of protein. The mechanism of ligand  
154 placement is based on binding site position. The protein ligand docking energy values

155 performance of this compound was based on the Scoring functions which is implemented in  
156 docking program to make various assumptions and implications to fit best complexes, which  
157 includes terms of hydrogen bonds employed by Argus lab 4.0.1 to rank the docked bases and to  
158 assess the binding site and the number of rotatable bonds present.

**Comment [A39]:** This is history. Give the method

### 159 **2.13 Ligand binding sites prediction**

160 After docking the docked structure was saved as “.Pdb” file and further explored to  
161 predict the binding sites using “ligand explorer” software. The predicted binding sites, based on  
162 the binding energy, and amino acids make up the binding cavity. Here ligand binding site  
163 represents the site where the ligands most efficiently bind with the protein, among all the active  
164 site.

### 165 **2.13 Discovery Studio Visualizer**

166 The docking results were visualized using Accelrys Discovery Studio 4.1 Visualizer. The  
167 discovery studio visualizer is also a free viewer that is designed to offer an interactive  
168 environment for viewing and editing molecular structures, sequences, X-ray reflection data,  
169 script and other data. DS Visualizer is handier for analyzing the docking results.
